What is Ghost, and what does the platform actually do?

GHOST ENTERPRISE ARCHITECTURE

Ghost turns live video streams into operational awareness in real time.

Ghost is an enterprise-grade visual intelligence platform. It combines advanced Vision AI and Large Language Models to provide deep contextual understanding of complex environments, letting operators interact with cameras using natural language.

The system lets organizations manage cameras as conversational entities — similar to modern messaging platforms — while maintaining strict enterprise security standards, deployment flexibility, and a privacy-focused architecture.

How does data flow through the system, and what are the design principles?

The Ghost processing engine receives video streams from existing security infrastructure using RTSP, HDMI capture, or isolated local integrations. Frames are analyzed in real time by AI models that generate structured operational narratives, alerts, and contextual insights.

core-pipeline copy

Security Cameras existing infra → **RTSP / HDMI** capture → **Ghost Vision AI** LLM + Vision → **Operator Interface** natural language

- **Zero Trust Architecture**
  Segregated access control, role-based permissions, and monitored data flow.
- **Privacy by Design**
  Minimized exposure of raw video and configurable retention policies.
- **Agentless Integration**
  No software agents required on cameras or NVR devices.
- **Operational Intelligence**
  Real-time contextual understanding instead of basic object detection.
- **Flexible Deployment**
  Supports local, isolated, hybrid-cloud, and enterprise SOC environments.

Deployment Models

Which deployment configurations does Ghost support?

Ghost supports multiple deployment configurations in order to comply with enterprise cybersecurity, compliance, and operational requirements.

Local RTSP Deployment
Processing within isolated enterprise networks.

Air-Gapped Environment
For highly sensitive facilities.

HDMI Capture Isolation
Isolated capture architecture.

Hybrid Cloud Architecture
Hybrid cloud intelligence environments.

Enterprise SOC Integration
Integration with Security Operations Centers (SOC) and enterprise SIEM platforms.

SECURITY & COMPLIANCE FRAMEWORK

- **Zero Trust Architecture**
- **Access Control & Audit Logs**
- **Encrypted Data Channels**
- **Minimal Data Retention**

How does Ghost handle security, retention, and regulated industries?

Ghost is designed around enterprise security standards and operational resilience. The platform minimizes long-term retention of raw video and focuses on generating structured AI-driven contextual memory layers.

Security capabilities include encrypted communication channels, configurable audit logging, role-based access control, isolated processing environments, and configurable retention policies.

The architecture is suitable for organizations operating under strict compliance requirements — including healthcare institutions, industrial facilities, financial organizations, logistics operators, critical infrastructure environments, and large-scale security operations centers.

Zero Trust	Encrypted	Agentless	Minimal
Segregated, role-based access	Secured data channels	No agents on cameras / NVR	Configurable retention
