What is Ghost, in one line?

CONFIDENTIAL · DEFENSE & NATIONAL SECURITY BRIEF

Your cameras already see everything. Now you can question them.

Ghost is the first chat interface for your cameras. It connects to the infrastructure you already operate and turns every feed — live and recorded — into a memory you question in plain language. Operators stop scrubbing footage and start asking.

Built for sovereign, air-gapped, and high-assurance environments.

- **Agentless** NO SOFTWARE ON CAMERAS
Ingests existing streams over RTSP, isolated HDMI capture, or local integrations.
- **Air-gap ready** DISCONNECTED SITES
Runs fully disconnected for high-assurance, sovereign facilities.
- **Zero-trust** NO IMPLICIT TRUST
Every request authenticated; no implicit trust between components.
- **Full audit trail** CHAIN OF CUSTODY
Role-based access with configurable, exportable audit logs.

Why isn't the footage we already record enough?

The footage already exists. The understanding doesn't.

Control rooms are saturated with feeds no one can watch in full. Critical moments are buried in hours of recording, scattered across dozens of cameras, recoverable only after the fact.

Ghost closes that gap — every camera becomes a conversation, every group of cameras becomes an investigation channel, and every recorded moment becomes textual memory you can search by simply asking.

- **Plain-language investigation**

Reconstruct an event across multiple cameras by asking, not searching.

- **Shift & sector summaries**

Generate handover and situation summaries for any timeframe or group of cameras.

- **Cross-camera channels**

Group cameras like conversations and investigate a whole sector as one thread.

How does Ghost actually work for an operator?

Ghost operates across three layers — talk to the past, the present, and a future you define yourself.

- **History you can talk to** MEMORY

Every sequence is continuously converted into rich, searchable text. Ask what happened at a location and timeframe and get an answer in seconds — no scrubbing, no jumping between cameras.

- **Ask what is happening now** LIVE

Query any camera or sector in real time and receive a plain-language description of the current situation, on demand.

- **Checks you define in natural language** WATCH

Describe a recurring check in your own words. Ghost runs exactly what you defined and flags deviations — it executes your intent, it does not decide on its own.

“Watch the loading bay and alert me the moment the emergency exit is blocked.”

A natural-language check, running continuously — you get only the deviations.

How does Ghost connect to our cameras?

Four stages. One direction. No agents on your cameras. Ghost ingests streams from your existing infrastructure over RTSP, isolated HDMI capture, or local integrations. Frames are interpreted into structured narratives and context, then surfaced to operators as plain-language conversations — without exposing raw footage beyond your boundary.

- **No agents required**

Nothing is installed on cameras or NVR devices.

- **Continuous textual logging**

A persistent, queryable record of the filmed environment, retained as structured memory.

Which deployment configurations do you support?

Ghost supports multiple deployment configurations to comply with the assurance, sovereignty, and operational requirements of defense and national-security organizations — from fully air-gapped sites to national control-center integrations.

On-prem / Local RTSP

Processing within isolated networks you control.

Air-gapped

Fully disconnected, high-assurance sites.

HDMI capture

Isolated capture with no network coupling.

Hybrid

Hybrid intelligence environments.

National / enterprise control center

Integration with existing operations centers.

BUILT FOR // OPERATIONAL DOMAINS

Critical infrastructure

Perimeter & site security

National & enterprise control rooms

Ports, borders & aviation

Energy & utilities

Government & defense facilities

How do you handle security, retention, and assurance?

Ghost is built around a zero-trust security model. Raw video exposure is minimized; structured memory layers persist instead, and all communication moves over encrypted channels end to end.

- **Zero-trust architecture**
Every request authenticated; no implicit trust between components.
- **Access control & audit logs**
Role-based access with configurable, exportable audit trails and chain of custody.
- **Encrypted channels**
All communication moves over encrypted channels, end to end.
- **Data minimization**
Raw video exposure is minimized; structured memory layers persist instead.

Zero-trust
No implicit trust

Encrypted
End-to-end channels

Agentless
Nothing on cameras

Auditable
Exportable trails
