Counter-UAS Field Report · 2026

What is LKM-Drone, and who is cleared to read this report?

GHOST LKM-DRONE · COUNTER-UAS FIELD REPORT

LKM-Drone turns the sensors you already field into an active aerial early-warning layer.

LKM-Drone is Ghost's counter-UAS Visual Intelligence system. It fuses behavioral AI, temporal analysis and thermal intelligence to detect, classify, track and alert on small aerial threats — including drones that appear as only a few pixels within a sensor frame.

This report documents the system doctrine, the proprietary detection engine, and results from a controlled counter-UAS field trial conducted across desert and border-sector terrain, day and night.

- **Classification**

SECRET // NOFORN. Released on a strict need-to-know basis under signed NDA and program access controls.

- **Distribution**

Named recipient only. No forwarding, reproduction, or storage on uncontrolled systems. Each copy is attributable.

- **Scope**

Doctrine, detection technology, and field-trial evidence. Sensor placements and site identities are withheld.

Why do small drones defeat conventional systems, and how is LKM-Drone different?

Small, low-cost drones fly low, move unpredictably, and generate minimal radar signature. At operational range a drone may occupy a handful of pixels — indistinguishable from background noise for conventional object recognition. The decisive question is not whether something *looks* like a drone, but whether it *behaves* like one.

Plate 1 — Counter-UAS field exercise. A single operator runs LKM-Drone against live airspace using a tripod thermal observation head; classification and tracking are surfaced on the tactical tablet. No dedicated radar is present.

- **Behavior over shape**
Instead of searching for a drone silhouette, Ghost evaluates motion, hovering bursts and course corrections across time.
- **Temporal, not single-frame**
A contact is judged on its trajectory and persistence — not a single ambiguous frame.
- **Discrimination by default**
Birds, debris and thermal noise are separated from stabilised flight before an alert is ever raised.

How does the engine turn faint motion into a defensible threat probability?

Three behavioral layers run together over every sensor and feed a single continuous loop — from observation through to investigation. Every contact carries a calibrated, auditable confidence score.

operator

- **Micro-Signature Tracking™**

Profiles position, acceleration, hovering and course-correction to separate drone from bird from aircraft with high precision.

- **Micro-Flutter Analysis™**

Extracts the thousands of per-minute stabilisation adjustments a flight controller makes — a fingerprint invisible to the eye.

- **Heat Atlas™**

Maintains a live thermal model of the scene, learning stable and dynamic zones so the system understands the environment before it searches for threats.

Continuously evaluated: motion trajectories · flight behavior · stabilization patterns · direction changes · thermal signatures · micro-vibrations · environmental anomalies · object persistence · threat probability.

What did the controlled field trial actually demonstrate?

Over a multi-night exercise across open terrain, LKM-Drone classified a stabilised quadcopter from a thermal-only feed and held the track through hovering bursts and course corrections — while rejecting birds and thermal noise as discarded contacts.

LKM-Drone enhances existing security investments rather than replacing them. It deploys rapidly across any combination of the sensors and platforms you already operate.

Existing surveillance cameras

Re-use the fleet already covering your site.

Thermal imaging systems

Thermal-only detection for night and zero-light.

Dedicated observation sensors

Purpose-built optics for long-range sectors.

Tactical edge computers

On-site inference with no cloud dependency.

Fixed & mobile command posts

Forward positions and permanent control centers, integrated into one operational picture.

HANDLING & DISTRIBUTION CONTROL

Need-to-know only

Named recipient · no forwarding

No uncontrolled storage

Destroy after program review
