I'm starting as a Ghost operator. Where do I begin?

GHOST ACADEMY · OPERATOR CERTIFICATION TRACK

Welcome. By the end of this program, every camera you operate will answer to you.

Ghost is not another wall of screens to stare at. It is a colleague that watches your site with you, remembers what it saw, and answers in plain language. Your cameras already see everything — this program teaches you to question them.

You were selected for this track because operating Ghost well is a craft. The system is deliberately simple — a conversation — but the difference between an average operator and an excellent one is enormous: in the questions they ask, the standing instructions they write, the alert rules they arm, and the way they run a shift.

50

Lessons, one per page

14

Hands-on field drills

1

Certification exam

BEFORE YOU BEGIN

Get your access sorted

You will need operator credentials for the Ghost console and at least one connected camera to practice with. If you have neither yet, Part II walks you through both. Keep this booklet open beside the console — every lesson is designed to be performed, not just read.

Tell Ghost what you want to learn first...

[+ New conversation](#)

Course parts

[01 Welcome & Orientation](#)[02 Doctrine & First Entry](#)[03 The Conversation Core](#)[04 Cameras & the Live Stage](#)[05 Organizing at Scale](#)[06 Standing Alerts](#)[07 Incident Management](#)[08 Memory & Intelligence](#)[09 Settings & Operations](#)[10 Craft & Certification](#)

How is the training structured, and how will I be evaluated?

Read a lesson. Perform it on a live console. Repeat until it is muscle memory.

Each page of this booklet is one lesson, framed the way you will actually work: a question to Ghost, and Ghost's answer. Lessons build on each other — the conversation core comes before cameras, cameras before organization at scale, organization before standing alerts. Do not skip ahead; an operator who arms alerts before mastering question phrasing writes rules that fire on noise.

- **Lessons**

Plain-language explanation of one capability: what it does, where it lives on screen, and when a professional reaches for it.

- **Field drills**

Marked exercises performed on a live console with a real camera. Each drill has a pass condition — do not move on until you meet it.

- **Doctrine notes**

The reasoning behind the interface. Knowing why Ghost is built as a conversation makes you faster when something unexpected happens.

- **Capstone & certification**

Part X closes with full-shift exercises and the certification exam: a timed, scenario-based practical assessment on a live site.

Plan for roughly two focused days: one for Parts I–V (conversation, cameras, organization) and one for Parts VI–X (alerts, incidents, memory, operations, certification).

[Ask about the certification requirements...](#)

- 10 Craft & Certification

Show me the full syllabus before we start.

Ten parts. From your first question to running an entire site.

I	Welcome & Orientation	3 lessons
II	Doctrine & First Entry	4 lessons
III	The Conversation Core	7 lessons
IV	Cameras & the Live Stage	7 lessons
V	Organizing a Site at Scale	5 lessons
VI	Standing Alerts	6 lessons
VII	Incident Management	4 lessons
VIII	Memory & Site Intelligence	5 lessons
IX	Settings & Daily Operations	4 lessons
X	The Operator's Craft & Certification	5 lessons

Parts III through VI are the heart of the craft — the conversation, the cameras, the structure, and the watch. Everything after them turns a competent user into a professional operator.

Before I touch anything — what exactly is Ghost?

DOCTRINE · LESSON 1

Ghost understands what your cameras see. It does not just detect things in front of them.

A conventional monitoring station shows you pixels and leaves the understanding to you. Ghost inverts that. Every camera becomes a conversation partner: you ask, in your own words, and Ghost answers about what is happening, what happened before, and what deviates from the instructions you gave it.

That distinction — understanding versus detecting — is the foundation of everything in this course. Ghost does not hand you a box labeled with an object class. It reads the scene: a delivery truck idling against the flow of the loading dock during shift change is a different fact than the same truck parked there at 03:00 with its lights off.

- **Past — a memory you can question**

"Did anyone approach the server-room door after the cleaning crew left?" Ghost answers from what it saw, with timestamps.

- **Present — eyes on the site right now**

"Is the fire lane by Gate 2 clear for the ambulance?" Ghost samples the live feed and answers in seconds.

- **Future — standing instructions**

"From now on, tell me if a vehicle stops on the perimeter road for more than two minutes." Ghost keeps the watch and interrupts you only on deviation.

Ask what makes Ghost different...

[+ New conversation](#)**Course parts**[01 Welcome & Orientation](#)[02 Doctrine & First Entry](#)[03 The Conversation Core](#)[04 Cameras & the Live Stage](#)[05 Organizing at Scale](#)[06 Standing Alerts](#)[07 Incident Management](#)[08 Memory & Intelligence](#)[09 Settings & Operations](#)[10 Craft & Certification](#)

If Ghost does the watching, what is my job?

DOCTRINE · LESSON 2

Ghost keeps the watch. You command it.

Your job shifts from staring at screens to directing an intelligence asset. You decide what matters on this site, encode it as questions, standing instructions, and alert rules — and judge what comes back. Ghost is tireless and literal; you supply context, priorities, and decisions.

- **You define what "normal" means**

Every site has its own rhythm. The night-shift forklift that is routine at a 24/7 depot is an anomaly at a sealed pharmaceutical warehouse. You teach Ghost the difference.

- **You ask the second question**

Ghost's first answer is rarely the end. "A maintenance contractor entered the electrical room" should trigger your follow-up: "Was he carrying anything when he left?"

- **You own every alert**

When Ghost interrupts, a human acknowledges, verifies on the live feed, and decides. Ghost never closes its own alerts — that is deliberate.

- **You keep the system honest**

Rules drift, cameras move, sites change. A professional operator reviews standing instructions at the start of every shift.

MINDSET CHECK**Write your site's three questions**

Before the next lesson, write down the three questions you most wish your cameras could answer about your site. You will ask Ghost all three by the end of Part III.

I've heard Ghost people say "three clicks." What does that mean?

DOCTRINE · LESSON 3

Anything that matters is at most three clicks away. Usually fewer.

Ghost's interface looks almost empty on purpose. There are no dashboards to configure, no grids of forty tiles, no nested menus. There is a sidebar of conversations and a chat. That austerity is a doctrine called 3CLICKS: an operator under pressure must reach any camera, any answer, and any control in three clicks or less.

three-clicks-to-any-camera

copy

Everything in this course honors that promise. When a lesson tells you where a control lives, count the clicks — you will rarely pass three. If you ever find yourself hunting through the interface, stop: you are missing a concept, not a button.

The corollary matters too: because the surface is small, mastery means depth, not coverage. You will learn every control in this booklet — there are fewer than you think, and each one earns its place.

Ask how the interface stays this small...

[+ New conversation](#)**Course parts**[01 Welcome & Orientation](#)[02 Doctrine & First Entry](#)[03 The Conversation Core](#)[04 Cameras & the Live Stage](#)[05 Organizing at Scale](#)[06 Standing Alerts](#)[07 Incident Management](#)[08 Memory & Intelligence](#)[09 Settings & Operations](#)[10 Craft & Certification](#)[How do I actually sign in to the console?](#)

ORIENTATION · LESSON 4

Two doors in. Credentials, or a quick-login link.

Ghost's console is reached through the Secure Access screen. You will use one of two paths, depending on how your site administrator provisioned you:

01 Agent credentials

Enter your agent name and your Ghost API key on the Secure Access screen, then press Sign in. The eye icon next to the key field toggles its visibility — keep it hidden whenever anyone else can see your screen.

02 Quick-login link

An administrator can issue you a one-time magic link. Opening it signs you straight into the console — no typing. Links are single-use and expire; treat an unused one like a key to the building.

03 Verify where you landed

After sign-in you should see the conversations sidebar on one side and an empty chat inviting you to start. If you see the marketing site instead, your session expired — sign in again.

Session discipline

Sessions expire on schedule. Ghost returns you to Secure Access — never leave a signed-in console unattended.

Guided tour

On your very first entry, a built-in tour spotlights the main controls. Let it run once — Part IX shows how to replay it.

10 Craft & Certification

Walk me through starting my very first conversation.

CONVERSATION CORE · LESSON 1

One conversation per camera, per concern. That is the whole data model.

Everything in Ghost lives inside conversations. A conversation typically represents one camera and one ongoing concern — "Loading Dock — North", "Pharmacy Cold Storage", "Perimeter Road East". You will open many; each keeps its own history, its own cameras, its own instructions, and its own alert rules.

01

Press the + button at the top of the sidebar

A fresh conversation appears, stamped with the date and time. It is selected automatically and the message box is focused, ready to type.

02

Ask something — even without a camera

Type a question and press Enter. Without a camera attached, Ghost converses from knowledge and from this conversation's history. Try: "What should I include in a handover summary for a night shift?"

03

Watch the answer stream

Ghost replies token by token. While it streams, the message box waits — one question, one answer, in order.

FIELD DRILL 1

Three conversations in three minutes

Create three conversations and exchange at least one question and answer in each. Pass condition: you can switch between them from the sidebar and each shows its own history.

Start a new conversation...

10 Craft & Certification

How do I phrase questions so Ghost gives me operational answers?

CONVERSATION CORE · LESSON 2

Ask about the situation, not about objects.

Ghost reads scenes the way a briefing officer would. The more operational intent your question carries, the sharper the answer. A question that names the concern — safety, security, operations, emergency — tells Ghost what matters in the frame and what to ignore.

ASK LIKE THIS

- "Is the forklift blocking the fire lane at the loading dock?"
- "Did the fuel tanker finish unloading, and were cones placed around it?"
- "Is anyone working at height on the scaffold without a harness?"
- "Has the gate been left open since the last delivery?"

NOT LIKE THIS

- "Is there a person in the frame?"
- "Do you see a car?"
- "Detect objects."
- "What's in the picture?"

The left column gets you decisions; the right column gets you inventory. When an answer feels generic, your question was generic — add the operational context and ask again. Follow-ups inherit the conversation's context, so "And now?" or "Has that changed?" work exactly as they would with a human colleague.

Is the emergency exit on dock 3 blocked right now?

What does every control around the message box do?

CONVERSATION CORE · LESSON 3

The composer is your command line. Four controls, total mastery required.

- **The message box**

Type and press Enter to send; Shift+Enter inserts a line break. While Ghost is answering, the box shows "waiting for reply" and pauses input — answers always arrive in order.

- **Live camera toggle**

The camera button beside the box. When live is on, every question you send is accompanied by freshly sampled frames from the connected cameras — Ghost answers about right now. When off, Ghost answers from history and knowledge only. This toggle is the single most important switch in the console.

- **Microphone**

When voice command is enabled in Settings, the mic button listens and types for you. Saying your send phrase (default: "go ghost") fires the message hands-free — invaluable when you are holding a radio.

- **Send button**

The arrow sends, same as Enter. If it is dimmed, either the box is empty or Ghost is still answering.

Above the box, a thin strip reports what is attached to your next message: which cameras are live, and whether voice is listening. Read that strip before you send — it is the difference between asking about the live scene and asking about the past.

FIELD DRILL 2

Same question, two modes

Ask the same question once with live off and once with live on (after Part IV teaches you to connect a camera, repeat this). Pass condition: you can explain the difference between the two answers.

Write a message to Ghost...

What should I notice inside Ghost's answers?

CONVERSATION CORE · LESSON 4

Every answer carries evidence. Learn to read all of it.

The thread is more than text. Professional operators extract four layers from every exchange:

- **The sampled frame**

When Ghost answered from a live camera, the answer carries a thumbnail of the exact frames it analyzed — watermarked with time and camera label. Click it to open a full-size preview; Esc closes. This is your evidence trail: the answer and what Ghost saw, side by side.

- **Timestamps on hover**

Hover any message to reveal its exact local time. In an investigation, "when was this asked" matters as much as the answer.

- **Copy controls**

Hovering your own messages reveals a copy button; code or structured blocks in Ghost's answers carry their own. Use them when filing reports — never retype evidence.

- **Multi-camera attribution**

When several cameras are live, Ghost answers per camera and labels each reply with the camera it describes. Never assume — read the label.

If you scroll up through history, a "jump to latest" button appears — one click returns you to the live end of the thread. During fast-moving events, stay at the bottom; the thread auto-follows new answers.

How do I keep dozens of conversations under control?

CONVERSATION CORE · LESSON 5

Name things like a professional. Future-you is the customer.

Hover any conversation in the sidebar and an action bar appears. These small controls are how a fifty-conversation site stays navigable:

- **Rename (pencil, or double-click the title)**

Give every long-lived conversation a name a stranger could navigate by: "Gate 2 — Vehicle Inspection Lane", not "camera test". Renaming locks the title against automatic changes.

- **Automatic naming (sparkles)**

By default, Ghost names new conversations from their content after the first exchanges. The sparkles button overrides this per conversation; the global switch lives in Settings → Response Tuning.

- **Delete (trash)**

Removes the conversation and its history immediately — there is no confirmation and no undo. Treat it like shredding a file: deliberate, never casual.

- **Status badges**

Each row shows what matters at a glance: a shield when alert mode is armed, a camera count when cameras are saved, a live badge when streaming, and the time of last activity.

FIELD DRILL 3

Naming sweep

Rename the three conversations from drill 1 using the pattern "Location — Concern". Pass condition: someone who has never seen your console could pick the right conversation in five seconds.

Rename this conversation...

[+ New conversation](#)

Course parts

[01 Welcome & Orientation](#)[02 Doctrine & First Entry](#)[03 The Conversation Core](#)[04 Cameras & the Live Stage](#)[05 Organizing at Scale](#)[06 Standing Alerts](#)[07 Incident Management](#)[08 Memory & Intelligence](#)[09 Settings & Operations](#)[10 Craft & Certification](#)[How do I give a conversation standing instructions?](#)

CONVERSATION CORE · LESSON 6

The system prompt is your standing order. Ghost obeys it in every single answer.

Open it from the sliders icon in the conversation header. Whatever you write there shapes every answer in this conversation — tone, focus, format, and priorities. It is the most underused control in the console, and the one that most separates professionals from beginners.

system-prompt · example · loading dock

"You are watching the north loading dock of a pharmaceutical warehouse. Priorities, in order: (1) the fire lane must stay clear, (2) cold-chain pallets must not wait outside the chiller for more than 10 minutes, (3) every truck at the dock must have its wheels chocked. Answer in two sentences or fewer. When you flag a problem, name the bay number."

- **Be concrete and ordered**

Numbered priorities beat prose. Ghost applies them in order when a scene contains several issues at once.

- **Dictate the format you need**

"Two sentences or fewer", "always include the bay number", "answer in Hebrew" — format instructions hold across the entire conversation.

- **Revisit on every site change**

New tenant, new traffic pattern, construction starting — the prompt must follow reality. A stale standing order is worse than none.

FIELD DRILL 4

Write one standing order, prove it holds

Set a system prompt that forces a two-sentence answer format, then ask three different questions. Pass condition: all three answers obey the format without being reminded.

Can I trade speed for accuracy per conversation?

CONVERSATION CORE · LESSON 7

Every conversation has its own dials. Tune them to the mission.

Settings → Response Tuning exposes per-conversation dials. They apply to the active conversation, so a perimeter watch and an investigation desk can run completely different profiles.

Accuracy level · 1–4

Left is fastest, right is most thorough. Routine status checks run at 1–2; evidence-grade analysis of a complex scene deserves 3–4.

Response length

Short, medium, or long. Live operations want short — you can always ask for elaboration. Shift-end summaries want long.

Image detail

How closely Ghost examines sampled frames. High resolves badge text and license plates at distance; low answers faster on busy scenes.

Capture quality

How sharply this browser samples camera frames before sending. Sharp by default; drop to fast on weak hardware or thin networks.

Recommended profiles: **Perimeter watch** — accuracy 2, short answers, low detail, fast capture: cadence beats nuance. **Investigation** — accuracy 4, long answers, high detail, sharp capture: nuance beats cadence. Set the profile when you create the conversation, and you will never think about it mid-shift.

How do I attach a camera to a conversation?

CAMERAS · LESSON 1

A conversation with a camera attached is a camera you can question.

01 Open the camera selector

In the conversation header, press "Add camera" — or flip the composer's live toggle when no camera is set up yet. Ghost lists every camera the console can reach. Grant the browser camera permission the first time.

02 Select one or more cameras

Click rows to select. A conversation can carry several cameras — a gate conversation often pairs the approach view with the barrier view.

03 Save Setup — or just Enable Live

"Save setup" binds the cameras to this conversation permanently and starts streaming. "Enable live" streams for this session only, without saving. For any conversation you intend to keep, save.

04 Confirm in the header

Saved cameras appear as labeled chips in the conversation header. The small × on each chip detaches it. The live stage (next lesson) appears above the composer.

FIELD DRILL 5

Attach, ask, verify

Attach a camera, save the setup, and ask: "Describe what you see and anything that needs operator attention." Pass condition: the answer carries a sampled frame and clearly matches the live scene.

Add a camera to this conversation...

10 Craft & Certification

What's the difference between saving a camera and just going live?

CAMERAS · LESSON 2

Saved is the contract. Live is the moment.

This distinction trips up every new operator, so commit it to memory:

Saved setup

Persistent. Lives with the conversation, survives sign-out and browser restarts, appears as chips in the header. Standing alerts and area-wide broadcasts use the saved setup as their source of truth.

Live session

Momentary. The composer toggle starts and stops streaming right now, in this browser. Turning live off does not unsave anything; turning it on without a setup opens the selector.

The professional pattern: save the correct camera set once, when you create the conversation — then use the live toggle freely throughout the shift. Stream when you are actively questioning; rest the toggle when you are not. Saved bindings quietly carry the rest of the system: when Part VI arms a standing alert, it watches the saved cameras; when Part V broadcasts to an area, it collects every saved camera inside it.

- **Removing a saved camera**

Press the x on its header chip. It detaches from the conversation and drops out of any live session at once.

- **Re-checking the binding**

Camera moved or replaced? Open the selector again and re-save. A conversation bound to yesterday's camera angle answers about the wrong scene with full confidence — re-save after every physical change.

09 Settings & Operations

10 Craft & Certification

What is the video panel above the message box?

CAMERAS · LESSON 3

The live stage is your eyes. The conversation is your judgment.

Whenever cameras are streaming, the live stage renders above the composer — one tile per camera, side by side when several are live. It exists so you never answer "did Ghost get it right?" from memory: the scene and the conversation share one screen.

- **Collapse / expand**

The chevron shrinks the stage to a slim bar when you need thread space, and restores it on click. The setting is global — it follows you across conversations.

- **Resize handles**

Drag the bottom corners to size the stage to your monitor. Ghost remembers your preferred size.

- **Connection states**

A tile shows "connecting" while a stream warms up and an explicit error if the camera cannot be reached. A black tile is a fact to act on — Part X's troubleshooting guide covers the causes.

- **Scene overlays**

The stage can silhouette people and vehicles in the frame as a quick orientation aid. Overlays pause automatically while alert mode is armed — the watch always takes priority over decoration.

Discipline note: the stage tempts new operators back into screen-staring. Resist it. Glance to verify; question to understand. Your throughput as an operator comes from the conversation, not the tiles.

08 Memory & Intelligence

09 Settings & Operations

10 Craft & Certification

Can I look closer at part of the frame?

CAMERAS · LESSON 4

Two ways of looking: the intel view and the enhanced view.

Each live tile carries an enhance control that switches between two operator views:

Intel view (default)

A calm, grayscale rendering of the full frame. Built for long watches — low fatigue, full situational coverage, nothing hidden.

Enhanced view

Full color with zoom and pan unlocked. Built for moments: reading a container number, checking whether the contractor's badge is clipped on, confirming what a driver placed by the fence.

- **Zoom — wheel or buttons**

Scroll the mouse wheel over the tile, or use the + / – controls. Up to 8x magnification in smooth steps.

- **Pan — drag**

Once zoomed past 1x, drag the image to move around the frame. The cursor switches to a grab hand.

- **Reset**

One press returns to 1x, centered. Always reset before handing the console over — the next operator must see the whole scene.

Critical detail: while a tile is enhanced and zoomed, the frames Ghost samples for your questions match what you are looking at. Frame the subject, then ask — "Read the placard on this trailer" works because Ghost sees your framing.

Enhance the view on tile 1...

09 Settings & Operations

10 Craft & Certification

How do I record what a camera is showing right now?

CAMERAS · LESSON 5

When something is happening, record first and keep questioning.

Every live tile has a record control. Recording captures the tile's stream into a clip you can download — your raw-footage layer for evidence and handover, running parallel to Ghost's written answers.

01

Start

Press record on the tile. A timer counts the take. If the camera carries audio and listening is on, audio is captured too.

02

Stop

Press again. The finished clip appears beside the tile, stamped with duration.

03

Download or discard

Download saves the clip file to the console machine; delete discards it. Clips live in this browser session — anything worth keeping must be downloaded before you sign out.

FIELD DRILL 6

The evidence sandwich

Start recording, ask Ghost two questions about the live scene, stop recording, download the clip. Pass condition: you hold a clip file plus the thread's written answers covering the same minute — a complete evidence package.

Doctrine: recording complements the conversation, it does not replace it. A clip shows what happened; the thread shows what it meant and when you knew it. Investigations want both.

Start recording on this camera...

Can I listen to a camera as well as watch it?

CAMERAS · LESSON 6

Some incidents are heard before they are seen.

Cameras that carry a microphone expose a listen control on their live tile. One press opens the audio channel through your console; press again to mute. Cameras without a microphone show the control as unavailable — that is the hardware, not a fault.

- **When to listen**

Verification moments: raised voices at a service counter, an alarm tone somewhere off-frame, machinery that sounds wrong before it looks wrong, glass breaking out of view.

- **When to stay muted**

Default state. Continuous audio fatigues you faster than continuous video, and a muted channel cannot mask the radio. Open audio deliberately, close it when verified.

- **Audio in recordings**

If listening is on while you record, the clip includes the audio track — note it in your incident log, and know your site's policy on audio capture before relying on it.

Privacy discipline applies double to audio. Many jurisdictions and most site policies treat sound differently from video. Your site lead will brief you on local rules — until then, treat audio as a verification tool, not a surveillance channel.

Listen to audio on this camera...

What actually happens when I ask a question with live cameras on?

CAMERAS · LESSON 7

Three frames, fairly sampled, faces masked, then analyzed.

Understanding the sampling pipeline makes you a sharper questioner. When you send with live cameras on:

- **Why three frames matter**

Spaced sampling captures motion: a pallet jack crossing the aisle, a door swinging shut, a vehicle still rolling versus parked. Ghost reads the change between frames, not just one frozen instant.

- **Why the first frame is discarded**

Cameras need a beat for exposure to settle. Ghost throws the warm-up frame away so analysis never runs on a half-lit image.

- **Faces are masked before analysis**

A privacy layer blurs faces in sampled frames before they leave your console. Ghost reasons about behavior, posture, equipment and context — not facial identity.

- **Operational consequence**

Sampling spans about two seconds. For a fast-moving event, ask short questions in rhythm rather than one long question after the moment has passed.

I have forty cameras. How do I keep the sidebar sane?

ORGANIZATION · LESSON 1

Mirror the site, not the org chart. Area → group → conversation.

The sidebar organizes conversations into a two-level tree, exactly like a well-run messaging workspace: **areas** contain **camera groups**, and groups contain conversations. A logistics campus might be: area "North Compound" → groups "Gates", "Loading Docks", "Warehouse Floor" → one conversation per camera.

01

Create an area

Press "New area" at the top of the organization section, type a name, press Enter. Name areas after physical zones: "Perimeter", "Production Hall B", "Visitor Parking".

02

Add groups inside it

Hover the area header and press the + that appears. Groups subdivide by function: "Entry Gates", "Emergency Exits", "Cold Storage".

03

File conversations

Hover a conversation, press the folder button, and choose its destination — a group, or directly in an area. "Unassigned" returns it to the free list.

Hover an area or group header for its management controls: rename, delete, and collapse. Deleting a container asks for confirmation and releases its conversations back to the free list — it never deletes the conversations themselves.

Create a new area...

Can I just drag things where I want them?

ORGANIZATION · LESSON 2

Everything in the tree moves by drag and drop.

- **Drag conversations anywhere**

Grab the handle on a hovered conversation and drop it into a group, directly into an area, or back onto the free list. Drop zones highlight as you pass over them.

- **Reorder within a container**

Order is yours to control. Put the busiest cameras at the top of each group — the ones you open ten times a shift should cost zero scrolling.

- **Move whole groups**

Groups drag too — reorder them inside an area or move a group to a different area entirely when the site is re-zoned.

- **Collapse what you are not watching**

The chevron on each area and group folds it away. A disciplined operator keeps only the active zone expanded — the tree shows state of attention, not just structure.

FIELD DRILL 7

Build your site tree

Create two areas with two groups each and file your existing conversations into them. Pass condition: nothing remains unassigned, and the busiest conversation sits first in its group.

Note: the tree is your console's working layout. Build it once, maintain it weekly — a tidy tree is what makes the three-clicks promise real on a large site.

Drag a conversation into a group...

Can I ask every camera in a zone the same question at once?

ORGANIZATION · LESSON 3

Question the zone, not the camera.

Every area and group can be opened as a **broadcast conversation**: one question, sent simultaneously to every saved camera inside that scope, with one labeled answer per camera. This is the control-room power move — a sweep of an entire zone in a single message.

01

Open the scope

Click the area or group name in the sidebar (or its radio icon, or the breadcrumb in the conversation header). The main view switches to the broadcast chat, showing the scope name and how many cameras it resolved.

02

Ask once

"Are all emergency exits clear and unobstructed?" — send. Ghost samples every camera in the scope and streams back one answer per camera, each labeled with its conversation and camera.

03

Read by exception, then close

Scan for the answers that report a problem; follow up inside the specific camera's own conversation. The × returns you to normal chat. Broadcast transcripts are ephemeral — working sessions, not archives.

broadcast · area: North Compound · 6 cameras

End-of-shift sweep: any door open, any vehicle remaining, anything that needs attention before lockdown?

Gate 1: barrier down, lane empty. **Dock 3:** one box truck still at bay 2, driver in cab. **Warehouse East:** pedestrian door propped open with a pallet...

Send to all cameras in this area...

Any sidebar tricks I should know before a busy shift?

ORGANIZATION · LESSON 4

The sidebar is your map table. Set it up like you mean it.

- **Resize by dragging the edge**

Drag the sidebar's inner edge to any width between compact and wide; double-click the handle to snap back to the default. Long conversation names deserve a wider rail.

- **Collapse for full-screen focus**

The close control folds the sidebar away entirely — the thread takes the whole monitor. A slim tab on the screen edge brings it back. Ghost remembers your choice between sessions.

- **Chat / Incidents tabs**

Two view tabs sit at the top of the rail. "Chat" is everything you have learned so far; "Incidents" opens the incident board from Part VII. A counter badge on the Incidents tab shows new incidents waiting for triage.

- **Live thumbnails on hover**

Hover a conversation that has saved cameras and its row shows a live thumbnail glimpse — confirm you are entering the right camera before you click.

- **The operator clock**

The header carries a seconds-precision local clock. When you log an event time in a report, that clock is your reference.

Footer controls — user switcher, theme toggle, Settings, and sign-out — are covered in Part IX. For now: know they live at the bottom of the rail, one click away.

Resize the sidebar...

Tie it together — how does a real shift use this structure?

ORGANIZATION · LESSON 5

Structure is speed. Here is the rhythm of a well-run console.

With the tree built and broadcast in your toolkit, a site sweep that once took twenty minutes of tile-staring becomes three moves:

shift-sweep-pattern

copy

Broadcast the area

one question, every camera

**Read by exception**

only flagged answers

**Drill into the camera**

its own conversation

- **Start of shift**

Broadcast each area: "Anything abnormal, unsafe, or out of place I should know about at handover?" Three areas, three questions, full situational picture in five minutes.

- **During the shift**

Work by exception. Standing alerts (Part VI) interrupt you when rules break; between interrupts, broadcast sweeps on a cadence appropriate to the site's risk.

- **End of shift**

A final broadcast sweep per area, plus a long-format summary question in each critical conversation — that output is the skeleton of your handover report.

FIELD DRILL 8

The five-minute sweep

Run a full start-of-shift sweep of your practice tree using broadcasts only. Pass condition: complete situational picture, under five minutes, without opening a single camera tile manually.

What exactly is alert mode, and when do I use it?

STANDING ALERTS · LESSON 1

You write the rule in plain language. Ghost keeps the watch. You decide.

Alert mode turns a conversation from a place you ask questions into a post that watches itself. You describe, in ordinary words, what counts as a deviation — Ghost continuously scans the conversation's saved cameras and interrupts you the moment reality matches the rule.

Each conversation carries its own rules and its own armed state — the cold-storage door watch and the perimeter loitering watch run independently, on their own cameras, with their own definitions of trouble.

Everything alert-related lives behind the shield icon in the conversation header. The small dot on the shield is a health summary you will learn to read in Lesson 4: green is watching, yellow is degraded, red needs you. The next five lessons take you from writing your first rule to handling a live alarm.

How do I write rules that catch real events and ignore noise?

STANDING ALERTS · LESSON 2

A good rule reads like an order to a guard: subject, condition, context.

Open the alert panel (shield icon), type a rule into the rule box, press Enter or the + to add it. A conversation can hold several rules; each has its own on/off toggle, and hover reveals a delete control. The craft is in the wording:

RULES THAT WORK

- "A person climbs or reaches over the perimeter fence"
- "A vehicle stops in the fire lane for more than a moment"
- "Someone enters the chemical store without a hi-vis vest"
- "The loading bay door is open with no staff present"
- "A person raises a hand high above their head"

RULES THAT MISFIRE

- "Anything suspicious" — no observable condition
- "A person appears" — fires on every employee
- "Theft" — a legal conclusion, not a visible event
- "Motion" — that is noise, not a rule

- **Describe what the camera can see**

Posture, position, clothing, equipment, door states, vehicle behavior. If a human watching the feed could not call it, neither can the rule.

- **One deviation per rule**

Split "open door or missing vest or loitering" into three rules. You get cleaner alerts and can toggle each watch independently.

Add a watch rule to this conversation...

My rules are written. How do I go live?

STANDING ALERTS · LESSON 3

Test the eyes, then arm the watch.

01 Confirm prerequisites

Arming requires a saved camera setup and at least one active rule. If the panel warns that a camera is required, the "Add camera" link inside the warning opens the selector directly.

02 Run the connection test

Press "Test connection". Ghost grabs a trial capture from the saved cameras and confirms the watch will actually see. Never skip this — an armed watch on a dead camera is a false sense of security, which is worse than none.

03 Flip the arming toggle

The conversation enters alert mode: scanning begins on the saved cameras, the shield dot goes green, and the conversation's sidebar row gains an alert-mode badge so every operator can see the post is armed.

04 Disarm deliberately

The same toggle stands the watch down. Disarm when work crews will legitimately trigger the rule, and re-arm when they leave — and say both in the handover log.

FIELD DRILL 9

First armed watch

Add the rule "a person raises a hand high above their head" to a conversation with your practice camera, test the connection, arm it, then step in front of the camera and raise your hand. Pass condition: the alert fires on you. Acknowledge it (next lessons), then disarm.

How do I know the armed watch is actually healthy?

STANDING ALERTS · LESSON 4

An armed watch you never verify is a story you tell yourself.

While armed, the alert panel shows a live status card — the heartbeat of the watch. Make reading it a habit at every check-in:

- **Camera channel**

Confirms frames are flowing from the saved cameras into the scan loop. If this degrades, the watch is blind — re-run the connection test and check the camera physically if it fails.

- **Push channel**

The live link that delivers alarms to your console instantly. "Connected" means an alert will reach you the second it fires; "disconnected" means delivery may lag — check your network, the channel reconnects automatically.

- **Last scan**

Timestamp of the most recent completed scan. It should refresh continuously — a stale value that stops advancing is your cue to disarm, fix, and re-arm.

- **The shield dot, decoded**

Green: armed and healthy. Yellow: armed but degraded (push channel down or scans lagging). Red: attention required. The dot is on the header — you see it from across the room.

Posts on trial access auto-disarm after a short demonstration window, with a countdown in the panel. Production credentials keep the watch armed until you stand it down.

Check the alert system status...

An alert just fired. What is the procedure?

STANDING ALERTS · LESSON 5

Mute. Verify. Acknowledge. In that order, every time.

A firing alert takes the whole screen: a full-screen overlay with a strobe border, an audible siren, the matched rule, Ghost's description of what it saw, and the captured frame. It is designed to be impossible to miss.

Your procedure:

01

Mute the siren

Press the mute control or the M key. Silence buys you focus; the overlay stays until you act on it.

02

Verify against the evidence

Read the matched rule, read Ghost's description, study the captured frame. Is this the deviation the rule was written for? You have the live feed one click away if you need the present tense.

03

Go to the conversation — or acknowledge

"Go to conversation" jumps you into the alerting camera's thread with the alert recorded in it, ready for follow-up questions: "Is the person still there? Which way did they go?" Acknowledge (Enter or Esc) closes the overlay and logs you as the human who took it.

04

Act per your site's escalation order

Ghost ends at the decision boundary. Radio, dispatch, lockdown calls — those belong to your standing orders. The thread you just built is your timeline when you write it up.

Acknowledgment is accountability: every alert records who cleared it. Never acknowledge an alarm you have not looked at — clearing blind is the cardinal sin of this profession.

Acknowledge the active alert...

Where do alerts live after the overlay is gone?

STANDING ALERTS · LESSON 6

Every alarm leaves a permanent record card in the conversation it came from.

After acknowledgment, the event remains as an alert card in the conversation's thread — a compact, SOC-style record:

- **The matched rule**

Exactly which standing instruction fired, quoted verbatim — essential when a conversation carries several rules.

- **Ghost's analysis**

What Ghost saw and why it judged the rule matched, in plain language. This is what you quote in the incident report.

- **The alert frame**

The captured frame, time-stamped and camera-labeled. Click to open it full size — the primary exhibit for any review.

- **Signal metadata**

Severity, camera feed tag, and event identifiers — the connective tissue that links this card to the incident pipeline in Part VII.

Because cards live in the thread, your follow-up questions sit directly beneath the evidence — the alert, the verification, and the resolution read as one continuous narrative. That narrative is what makes audits painless.

FIELD DRILL 10

Narrate an alert end-to-end

Using drill 9's alert: under its card, ask Ghost two follow-up questions about the scene, then write one summary line of your own. Pass condition: a colleague reading just that thread understands what happened, when, and how it ended.

What is the Incidents tab in the sidebar?

INCIDENTS · LESSON 1

Alerts are moments. Incidents are the cases they become.

Switch the sidebar to the **Incidents** tab and the main view becomes the incident board — a column flow that tracks every case from first signal to closure. Ghost feeds it automatically: alert events arriving close together on the same post are merged into a single incident, given an AI severity assessment and a working summary, and placed in the first column.

- **The badge is your queue**

The counter on the Incidents tab shows cases awaiting triage. A professional console runs that badge to zero every shift.

- **Merging tames alarm storms**

A person testing the fence will trip the same rule five times in a minute. The board shows one incident with five events — you triage a case, not a flood.

- **KPIs across the top**

Open counts, response times, and closure statistics — your shift's performance picture at a glance.

I opened an incident. What can I do inside it?

INCIDENTS · LESSON 2

One case, one room: timeline, evidence, notes, people.

Clicking an incident opens its workspace — the case file where everything about the event lives together:

- **Timeline**

Every event in the case in strict order: the triggering alerts, status changes, assignments, notes, and closures — each stamped with time and author. This is the document an after-action review reads first.

- **Evidence**

Alert frames attach automatically; you add more as the case develops — additional captures, downloaded clips, relevant documents. Evidence added during the event is worth ten times evidence reconstructed after it.

- **Notes**

Your operational annotations: "Patrol dispatched 14:32", "Contractor confirmed authorized by site manager", "Gate relocked and verified". Write notes as facts with times, not impressions.

- **Assignment**

Assign the incident to the operator who owns it. One case, one owner — shared ownership is how cases stall between shifts.

- **Status & severity**

Move the case along the column flow and correct the AI's severity call when your judgment differs. The human grade is the one that counts.

Correlated incidents — other cases involving the same post or window — surface alongside, so a pattern across three nights is visible the moment you open the third case.

Can Ghost help me investigate and write up a case?

INCIDENTS · LESSON 3

Ghost drafts. You verify, correct, and sign.

Two AI actions inside the workspace save you the slowest parts of casework:

Investigate

Ghost reviews the incident's events, frames, and notes, and returns an analysis: most likely sequence, gaps worth checking, follow-up questions worth asking the cameras.

Summarize

Ghost drafts a case summary from the timeline — what fired, when, what was done, how it ended. The skeleton of your closure report, generated in seconds.

- **Treat AI output as a draft from a sharp junior analyst**
Usually right, occasionally confidently wrong. Check every time against the frames before a claim enters the official record.
- **Feed the case file first**
Investigation quality tracks evidence quality. Notes with times, attached frames, and clean status changes give Ghost — and the next shift — something real to reason over.
- **Loop back to the cameras**
The investigation's open questions are literally askable: jump to the post's conversation and put them to the camera. "Did the vehicle return after 02:00?" closes a gap in one exchange.

FIELD DRILL 11

Case work, end to end

Take the incident created by your drill-9 alert: assign it to yourself, add one note with a time, run Investigate, then Summarize. Pass condition: the summary is accurate enough that you would sign it with one edit or fewer.

When and how do I close a case properly?

INCIDENTS · LESSON 4

A case is closed when the story is complete — not when the noise stops.

Closure is a deliberate act with its own dialog: a resolution classification and a closing summary, stamped into the timeline forever. Before you close, run the three-question audit:

01 Is the cause established?

"Contractor entered the wrong door — badge valid, signage missing" closes. "It stopped happening" does not; that case is resolved-unexplained and your handover should say so.

02 Is the action recorded?

Whatever was done — patrol dispatched, door secured, rule reworded, no action warranted — must appear in notes with a time. An empty timeline plus a closed status is an audit finding waiting to happen.

03 Did the system learn?

Every false alarm is a rule asking to be sharpened, and every real catch may justify widening a watch. Feed the lesson back into Part VI before you close the tab.

The board's KPIs aggregate from exactly these habits: time-to-acknowledge, time-to-close, open-case age. They are not surveillance of you — they are the site's early-warning system for understaffed shifts and noisy rules. Keep the data honest by keeping the casework honest.

Heads-up displays come and go; the incident archive is the institution's memory. Five years from now, the only account of tonight will be what you wrote in that workspace.

Ghost says it remembers what it saw. Where do I see that memory?

MEMORY · LESSON 1

Three layers of memory, one brain icon in the header.

The brain icon in the conversation header opens the memory panel — your window into what this conversation has accumulated about its scene. It holds three layers:

- **Tracking**

With the tracking toggle on, Ghost continuously logs what moves through the scene — people, vehicles, equipment — building a structured record of activity. Filters and search let you cut the log by type and time.

- **Observations**

Visual memory: entities and scene facts Ghost has noticed across its samples — the white van that visits every morning, the pallet stack that has been growing by the east wall.

- **Facts**

Distilled, standing knowledge this conversation holds: things stated or established that shape future answers. Each fact carries a delete control — memory you can prune.

Maintenance is part of the craft: when the site changes, stale facts mislead future answers. Open the panel after every site change, read what Ghost believes, and delete what is no longer true. The tracking engine yields automatically while alert mode is armed — the watch always has priority over the diary.

Open the memory panel...

What does the scan button in the header do?

MEMORY · LESSON 2

One press reads the whole place — a structured survey of the scene.

The scan-eye button in the conversation header triggers a **Site Intelligence** report: Ghost samples the camera and returns not an answer to a question, but a structured read of the entire environment — layout, zones, entry points, activity, equipment, and anything an experienced supervisor would flag on a first walk-through.

- **When you adopt a new camera**

Run a scan as your first act. The report orients you — and the conversation — to what this view actually covers and where its blind edges are.

- **At a shift's start on critical posts**

A scan gives you a baseline. Anything that deviates from it later in the shift is a question waiting to be asked.

- **Before writing alert rules**

The report names the features your rules should reference — the fire lane, the fence line, the chemical store door — in the language Ghost itself uses for this scene.

site-intelligence · excerpt

Coverage: single fixed view over the north loading apron; two dock doors, one pedestrian door, fire lane along the left edge. **Activity:** one box truck at bay 2, dock plate down, two staff handling pallets. **Attention:** pedestrian door propped open; pallet stack within a meter of the fire lane boundary...

The report lands in the thread like any answer — with its sampled frame — so it is quotable, copyable, and part of the record.

Run a site intelligence scan...

How do I investigate something that already happened?

MEMORY · LESSON 3

Ask the past like you ask the present. Who, what, when — with timestamps back.

Because every answer, frame, alert card, and tracked entity persists in the conversation, history is not footage to scrub — it is a record to question. Keep live off (you are asking about then, not now) and interrogate:

INVESTIGATION QUESTIONS

- "Summarize everything unusual in this conversation since 22:00."
- "When did the box truck at bay 2 leave, and was the dock door closed after it?"
- "Did anyone enter through the propped pedestrian door while it was open?"
- "List every alert tonight in order, one line each, with times."

KEEP IN MIND

- Ghost's past is what it observed and recorded — sampled moments, not a continuous tape
- Memory is per conversation: ask the camera that was there
- For zone-wide history, ask each relevant post, then have one conversation merge the picture

The discipline of timestamps: always ask for times, and always cross-check a critical time against the message hover-timestamps and the frame watermarks. When your report says 02:47, three sources should agree.

FIELD DRILL 12

Reconstruct an hour

Pick a conversation with at least an hour of history and reconstruct that hour using questions only — no scrolling. Pass condition: a timeline of events with times, verified against the thread's own timestamps.

Who was at the east gate during the night?...

Can Ghost use my site's documents — procedures, layouts, contact lists?

MEMORY · LESSON 4

Give Ghost your paperwork, and its answers start citing your procedures.

The knowledge base holds documents Ghost can draw on when answering: standard operating procedures, site maps and zone definitions, escalation contact lists, contractor schedules, safety rules. Upload files (PDF, Word, text) or paste text directly as a source; tag each source so it is findable later.

- **What belongs in it**

Anything you would want a new operator to have read: "Fire lane policy", "After-hours contractor procedure", "Tanker unloading checklist". If your shift quotes it, Ghost should hold it.

- **Activate and deactivate sources**

Each source toggles on and off without deleting — switch seasonal procedures in and out as the site's posture changes.

- **Keep it current**

An outdated procedure in the knowledge base is worse than none: Ghost will quote it with confidence. Version your uploads and retire the old one in the same action.

The payoff shows in answers: ask "the dock door is jammed open — what is the procedure and who do I call?" and Ghost answers from *your* SOP with *your* escalation contacts, not from generic knowledge. That is the difference between an assistant and a trained colleague.

How do I keep all this accumulated memory accurate?

MEMORY · LESSON 5

Memory is an asset only while it is true.

Everything in this part — tracking logs, observations, facts, knowledge sources — improves answers while it reflects reality and degrades them when it does not. Professional consoles run a hygiene routine:

01

Weekly: read the facts layer

Open the memory panel on your critical conversations and read what Ghost holds as standing truth. Delete anything the site has outgrown — the relocated fuel cage, the contractor whose project ended.

02

On every physical change: re-baseline

Camera moved, wall built, layout re-zoned: re-run Site Intelligence, correct the system prompt, re-check alert rules, and prune stale observations — in that order.

03

Monthly: audit the knowledge base

Every source gets one question: is this still the current version? Replace or deactivate anything that is not.

04

Tune the tracking flow

The memory panel's batch controls govern how tracked detections accumulate and flush. Busy scenes may warrant larger batches; quiet critical posts, immediate ones. Defaults are sound — change them with a reason.

The principle from Part II returns: you keep the system honest. Ghost will never resent a deletion — but it will faithfully repeat yesterday's truth until you correct it.

How are operator accounts managed on a shared console?

OPERATIONS · LESSON 1

One console, many operators — each with their own identity.

The Settings panel opens from the gear at the bottom of the sidebar (Esc closes it). Its first section, **Account & Users**, manages who the console works as:

- **The user list**

Every operator provisioned on this console, with the active one badged. Conversations, areas, and alert ownership follow the active user.

- **Adding an operator**

A nickname plus a Ghost API key creates a new operator identity. The eye toggle shows the key while you paste it — hide it again before anyone walks past.

- **Switching operators**

The user row in the sidebar footer switches the active operator — at shift change, switch before you type anything, so the night's record is attributed to the right person.

- **Signing out**

The sign-out control in the sidebar footer ends the session and returns to Secure Access. Walking away from a signed-in console is the operational equivalent of leaving keys in a door.

Attribution is the quiet backbone of everything in Parts VI and VII: acknowledgments, notes, and closures are signed by the active user. Keep the identity honest and the audit trail stays honest by itself.

How do I get a teammate into the console without sharing keys?

OPERATIONS · LESSON 2

A link instead of a key: single-use, expiring, copy-safe.

Settings → **Quick Access** issues magic login links — the right way to hand access to a teammate, a relief operator, or your own second device. Never share API keys; share links.

01

Generate

One press creates a fresh link for the active user and copies it to the clipboard automatically. A countdown shows its remaining validity.

02

Deliver over a trusted channel

Hand the link over your site's approved messaging channel. Whoever opens it lands signed in — so treat an unsent link like a signed blank pass.

03

Regenerate when in doubt

Links are single-use and time-boxed; the regenerate control voids the old one and issues fresh. If a link may have leaked, regenerate first and investigate second.

Use for

Shift relief, supervisor spot-checks, your own tablet at the gatehouse, controlled demonstrations.

Never for

Posting in group chats, email signatures, taping to the monitor, or anyone you would not badge into the control room.

Generate a quick-login link...

Can I operate Ghost hands-free?

OPERATIONS · LESSON 3

Eyes on the scene, hands on the radio — voice runs the console.

Settings → **Voice Command** configures hands-free operation. With voice enabled, the composer gains a microphone; speech becomes text in the message box, and speaking your **send phrase** fires the message without touching anything.

- **The enable switch**

Turns the voice system on or off for this console. Off means no microphone button and no listening, ever — some rooms require that posture.

- **The send phrase**

One or two words, your choice (default: "go ghost"). Pick something you will never say mid-sentence — "send it" fires accidentally; "ghost go" does not. Save to apply.

- **The listening strip**

While the mic is hot, a strip above the composer shows what is being heard and reminds you of the send phrase. Glance at it before you speak the phrase — confirm the transcription says what you mean.

Where voice earns its keep: gatehouse posts where your hands hold a barrier remote and a radio; live pursuits across the stage where looking down costs you the subject; gloved hands in cold rooms. Where it does not: open-plan control rooms where three consoles would hear each other's phrases — coordinate phrases with your neighbors, or keep voice off.

Say your send phrase...

How do I adapt the console itself — language, appearance, refreshers?

OPERATIONS · LESSON 4

The console adapts to the operator — not the other way around.

Language — HE / EN

The toggle in the conversation header flips the entire interface between Hebrew (right-to-left) and English (left-to-right) instantly. Ghost's answers follow the language you ask in, regardless of interface language.

Theme — dark / light

The sun/moon control in the sidebar footer. Dark is doctrine for night shifts and dim rooms; light holds up in sun-washed gatehouses. Your choice persists per console.

Auto-naming — global switch

Settings → Response Tuning carries the global switch for automatic conversation naming, alongside the per-conversation sparkles override from Part III.

Learning center

Settings → Learning tracks your progress through the built-in guided chapters and reopens any of them — including the first-entry tour — on demand.

The learning center is your refresher between formal trainings: eleven short guided chapters, each spotlighting one capability on the live console. A professional habit worth stealing: when a feature in this booklet has gone unused for a month, replay its chapter before the shift where you will need it.

FIELD DRILL 13

Console personalization pass

Set your preferred language and theme, confirm your send phrase, and replay one learning-center chapter of your choice. Pass condition: under three minutes for the full pass — these controls should be reflex by now.

Switch the interface language...

Put it all together — what does a professional shift look like?

THE CRAFT · LESSON 1

Excellence is a checklist run so often it disappears.

01 Take over deliberately (first 10 minutes)

Switch the console to your user. Read the outgoing operator's handover. Check every armed post's shield dot and status card. Run the incident board's badge to zero with triage. Then broadcast-sweep each area: "anything abnormal, unsafe, or out of place?"

02 Run the watch (the long middle)

Work by exception: standing alerts interrupt, broadcast sweeps on cadence fill the gaps. Verify every alarm against its frame before acknowledging. Note actions in the incident workspace as they happen — never "later".

03 Investigate in the conversation, not in your head

Every hunch becomes a question to the relevant camera. The thread is your worknotes — if you wondered it, ask it, so the record shows what was checked.

04 Hand over in writing (last 15 minutes)

Final sweep per area. In each critical conversation, ask for a long-format shift summary. Open incidents get a status note. Disarmed posts get a reason and a re-arm time. Your relief should need five minutes, not fifty.

The routine is the floor, not the ceiling: it guarantees a competent shift on your worst day and frees your attention for judgment on the days that demand it.

Start the shift checklist...

- 10 **Craft & Certification**

Something's not working. Give me the field guide.

THE CRAFT · LESSON 2

Diagnose in order: camera, channel, rule, question.

- **Black or "connecting" tile**

Camera permission, cable, or device. Re-open the camera selector and re-pick the device; if it lists nothing, the browser lost camera permission or the camera lost power. Physical check beats refresh.

- **Answers ignore the live scene**

The live toggle is off, or no cameras are saved. Check the strip above the composer — it tells you exactly what your next message carries.

- **Alert never fires**

In order: is the conversation armed (shield dot)? Is the specific rule toggled active? Does the rule describe something visible on this camera's actual view? Run Site Intelligence and read what Ghost can see — then re-word the rule in those terms.

- **Alert fires constantly**

The rule names a normal condition. Add the distinguishing context: not "a vehicle at the gate" but "a vehicle waiting at the gate with no guard present for more than a minute".

- **Yellow shield dot**

Armed but degraded — usually the push channel. Check the panel's status card; the channel reconnects on its own, but verify "last scan" is still advancing.

- **Vague answers**

Usually a vague question — add the operational concern. Then check the dials: accuracy and image detail may be tuned for speed on a conversation that now needs precision.

- **Session bounced to Secure Access**

Sessions expire by design. Sign back in, or keep a quick-login link from Part IX ready for exactly this moment.

Escalate to your site administrator anything the guide does not clear in ten minutes — with the conversation name, the time, and what you already ruled out.

Run the connection test...

- 10 **Craft & Certification**

What are the non-negotiables on security and privacy?

THE CRAFT · LESSON 3

You operate a sensitive instrument. These rules are not optional.

- **Credentials**

API keys are never typed in view of others, never shared, never written down. Access for others flows through quick-login links over approved channels — single-use, expiring, revocable.

- **The console is attributed space**

Work as yourself; switch users at relief; sign out when you step away. Every acknowledgment and closure carries a name — make sure it is the right one.

- **Privacy is built in — keep it that way**

Faces are masked in sampled frames before analysis; Ghost reasons about behavior and context, not identity. Do not attempt to defeat this, and follow site policy on audio monitoring and clip retention.

- **Evidence handling**

Downloaded clips and frames are controlled material: store them in your site's designated evidence location, never on personal devices, and log handoffs in the incident workspace.

- **Watch the watcher**

If Ghost ever shows a classified-content warning in the thread, treat it as a real signal: someone or something fed sensitive material into a conversation. Report it like any other security event.

- **Proportionality**

Ghost watches for deviations you define. Define them for safety, security, and operations — never for curiosity about individuals. Your rules are an ethical document; write them so you would be comfortable reading them aloud.

I'm ready to prove it. What are the capstone exercises?

THE CRAFT · LESSON 4

Four scenarios, one console, no notes. Complete all four to qualify for the exam.

01

Capstone A — Cold start (20 min)

A fresh console: build a two-area tree, attach and save cameras, write system prompts for two posts, set tuning profiles. Pass: a colleague can run the site from your structure without questions.

02

Capstone B — The watch (20 min)

Arm two posts with two rules each — one safety, one security. Trigger one rule legitimately on camera, work the full alarm procedure, and close the resulting incident with a signed summary. Pass: clean timeline from rule to closure.

03

Capstone C — The investigation (15 min)

Using only questions to the past — no scrolling — reconstruct the last two hours of a busy conversation into a timed event log, verified against thread timestamps. Pass: no discrepancy over one minute.

04

Capstone D — The sweep under pressure (10 min)

With one alert armed and live, run a complete multi-area broadcast sweep and produce a written handover — while correctly handling any alarm that fires mid-sweep. Pass: nothing missed, nothing acknowledged blind.

Run the capstones with a supervising operator observing. The standard is not speed for its own sake — it is calm, attributable, complete work at operational tempo.

Begin the capstone...

What does certification involve, and what comes after?

THE CRAFT · LESSON 5

Certification is a beginning. The craft compounds from here.

The certification exam is a proctored, scenario-based practical on a live site: ninety minutes, unscripted events, the full breadth of this booklet. You are graded on procedure, judgment, documentation quality, and the honesty of your handover — in that order. A pass certifies you as a **Ghost Certified Operator**.

90 minPractical exam,
live site**4 / 4**Capstones
required to sit**2 days**Typical course
duration**1 year**Certification
validity

- **Keep drilling**

The fourteen field drills in this booklet are designed for repetition. Re-run one each week — rotation keeps every capability warm.

- **Teach the next operator**

The fastest way to deepen the craft is to walk a new colleague through Parts III and VI. If you cannot explain the saved-versus-live distinction in one minute, you have found your own gap.

- **Feed the doctrine back**

Rules that earned their keep, prompts that sharpened a post, sweeps that caught what mattered — write them up for your site's playbook. Doctrine is built by operators, not manuals.

Your cameras see everything. Now you know how to question them.
